

TABLE OF CONTENTS

II - MATERIALS AND APPLICATIONS

Foreword by Professor Louis Néel	XXI
Preface	XXIII
Acknowledgements	XXIV

MAGNETIC MATERIALS AND THEIR APPLICATIONS

15 - Permanent magnets	3
1. Implementation of magnets.....	4
1.1. The two hysteresis loops of a material: magnetization loop M(H) and induction loop B(H).....	4
1.2. Operation of an ideal permanent magnet within a system.....	4
1.2.1. Load line and working point of a magnet	5
1.2.2. Static and dynamic operation of a permanent magnet	7
1.2.3. The maximum energy product (static operation)	8
1.2.4. Free energy involved in the dynamic operation of a magnet	10
1.3. Performance parameters of real magnet materials.....	10
1.3.1. Magnetization and induction loops of various hard magnetic materials	10
1.3.2. The maximum energy product $(BH)_{max}$	11
1.3.3. Performance parameters, and their range of variation.....	12
2. Oriented (textured) and isotropic magnets	14
2.1. Magnet classification.....	14
2.2. Comparison of the magnetic behavior of oriented and isotropic magnets.....	15
3. Principal industrial magnet materials.....	17
3.1. The various types of sintered and oriented magnets.....	17
3.1.1. AlNiCo magnets.....	18
3.1.2. Ferrite magnets.....	18
3.1.3. Samarium-cobalt magnets.....	18
3.1.4. Neodymium-iron-boron magnets	19
3.2. Parameters and typical curves	19
3.2.1. Sintered and oriented magnets	19
3.2.2. Bonded magnets	20
4. Uses of permanent magnets.....	21
4.1. The principal fields of permanent magnet applications	21
4.1.1. Miniaturization.....	21
4.1.2. Permanent field sources	23
4.1.3. Repelling magnets.....	23
4.2. Properties of industrial magnets.....	24
4.2.1. Principal properties of the AlNiCo magnets	24
4.2.2. Main characteristics of ferrite magnets	25
4.2.3. Main properties of rare earth magnets	26

4.3. Electromagnetic systems	27
4.3.1. The evolution of motors	28
4.3.2. Permanent magnet actuators	29
4.4. Magnetomechanical systems	30
4.4.1. Magnetic bearings	30
4.4.2. Magnetic couplings	31
4.5. Field sources.....	32
4.5.1. Sensors	32
4.5.2. Eddy current systems.....	33
4.5.3. Field source.....	34
4.6. Modelling permanent magnet systems	36
4.6.1. Closed circuit calculations.....	36
4.6.2. Open circuit calculations.....	36
4.6.3. Numerical methods	37
4.6.4. Magnet characteristics	39
5. Magnet materials: microstructure and preparation techniques.....	39
5.1. Coercivity and how to enhance it.....	39
5.1.1. Strong uniaxial anisotropy	40
5.1.2. The role of defects and the need for a microstructure	40
5.2. The magnet material must be reduced to fine particles	40
5.2.1. Reduction into grains to suppress nucleation	41
5.2.2. Reduction into grains to increase remanence and the squareness of the M(H) loop ..	41
5.3. General principles of the processes used to prepare magnet microstructures	42
5.3.1. Oriented sintered magnets.....	42
5.3.2. Coercive powders and bonded magnets	44
6. The basic materials for permanent magnets.....	45
6.1. Magnetic characteristics of 3d and 4f elements	
vs the properties required to obtain a hard magnetic material.....	45
6.1.1. Magnetic moments and exchange interactions in rare earth and transition metals....	46
6.1.2. Magnetocrystalline anisotropy of 3d and 4f elements	47
6.2. Transition metal based magnet materials	48
6.3. R-M intermetallic alloys (R = rare earth, M = transition metal)	51
6.3.1. R-M exchange coupling, via the d electrons.....	51
6.3.2. R-M coupling = ferromagnetism or ferrimagnetism.....	55
6.3.3. Magnetocrystalline anisotropy in R-M compounds	
with uniaxial crystallographic structure: easy axis or easy plane	56
6.4. Review of intermetallic compounds.....	57
6.4.1. Binary $R_x M_{1-x}$ compounds.....	58
6.4.2. Ternary compounds.....	62
6.4.3. Interstitial ternary compounds	63
7. Magnetization reversal mechanisms	64
7.1. Magnetization reversal in magnetic systems devoid	
of magnetocrystalline anisotropy: application to AlNiCo magnets	64
7.2. Magnetization reversal in systems with strong magnetocrystalline anisotropy:	
non-collective reversal in stages.....	66
7.2.1. Stages of the process.....	66
7.2.2. The driving forces of reversal: magnetic fields and thermal effects	67
7.3. The magnetization reversal field H_R :	
relationship with the intrinsic magnetic properties of the principal phase.....	67
7.3.1. H_R as a function of H_A and local dipolar effects	68
7.3.2. H_R as a function of the energy barrier for the critical mechanism.....	69

7.4. Which mechanism determines magnetization reversal?	71
7.4.1. Analysis of the initial magnetization curve, particularly the initial susceptibility...71	
7.4.2. Observation of domains and domain wall motion in the thermally demagnetised state.....	72
7.4.3. Variation of the reversal field with the direction of the applied field: $H_R(\theta_c)$	73
7.4.4. Modelling of the different mechanisms involved in non-collective magnetization reversal.....	75
Exercises.....	76
Solution to the exercises	81
References	86
16 - Soft materials for electrical engineering and low frequency electronics.....	89
1. General presentation of soft materials.....	89
1.1. The properties required of a soft material	90
1.2. Role of structural and electromagnetic characteristics	90
1.2.1. Polarization.....	90
1.2.2. Permeability.....	91
1.2.3. Energy dissipation.....	92
1.3. Energy loss analysis.....	92
1.3.1. Macroscopic aspects.....	92
1.3.2. Calculation of losses in a conductor.....	93
1.4. Losses in rotating or trapezoidal field.....	96
2. Iron based crystalline materials.....	96
2.1. Iron and soft steels.....	96
2.2. Classical iron-silicon alloys.....	97
2.3. Fe-Si sheets with non oriented (NO) grains.....	99
2.3.1. Magnetic characteristics.....	99
2.3.2. Applications.....	100
2.3.3. Evolution and prospects of NO sheets	100
2.4. Grain-oriented (GO) Fe-Si sheets	101
2.4.1. Domain structure optimization.....	102
2.4.2. Magnetic characteristics.....	103
2.5. Thin iron-silicon sheets	104
2.6. High silicon content alloys.....	105
2.6.1. Alloys obtained by fast solidification	105
2.6.2. Diffusion enriched alloys	107
3. Iron-nickel and iron-cobalt alloys.....	108
3.1. Iron-nickel family	108
3.1.1. Alloys around 30% Ni.....	109
3.1.2. Alloys around 50% Ni.....	109
3.1.3. Alloys around 80% Ni (Permalloys).....	110
3.2. Iron-cobalt alloys.....	111
4. Soft ferrites.....	112
4.1. Electromagnetic properties.....	112
4.1.1. Saturation polarization	112
4.1.2. Curie temperature.....	112
4.1.3. Anisotropy.....	113
4.1.4. Magnetostriction.....	113
4.1.5. Resistivity.....	113
4.1.6. Permeability - cutoff frequency product.....	113

4.2. Applications of ferrites	114
4.2.1. Power electronics	114
4.2.2. Low power applications.....	114
5. Amorphous alloys.....	114
5.1. General characteristics.....	115
5.2. Main classes of soft amorphous alloys.....	115
5.2.1. High polarization alloys	115
5.2.2. Low magnetostriction alloys	116
5.3. Applications of amorphous alloys.....	116
6. Nanocrystalline materials	117
6.1. Electromagnetic characteristics	118
6.1.1. Polarization.....	118
6.1.2. Anisotropy.....	118
6.1.3. Magnetostriction.....	118
6.1.4. Resistivity.....	119
6.1.5. Uniaxial induced anisotropy.....	119
6.2. Random anisotropy model	119
6.3. Applications of nanocrystalline materials	121
7. Energy conversion at industrial frequencies (50-400 Hz).....	122
7.1. Distribution transformers	123
7.2. Rotating machines.....	127
7.2.1. A refresher on magnetic system energy.....	127
7.2.2. Application to the study of some structures.....	128
7.2.3. The main classes of machines.....	132
7.2.4. Soft magnetic materials used in rotating machines.....	134
8. Actuators.....	134
8.1. An example of a rotating actuator: stepping machine with variable reluctance.....	135
8.2. Choice criteria, orders of magnitude.....	141
9. Energy transformation in power electronics	143
9.1. Smoothing inductances, and components for inductive energy storage	143
9.2. Requirements associated with high frequency.....	144
9.3. Control-power interfacing.....	146
9.3.1. Maximum pulse length	146
9.3.2. Response time.....	146
9.3.3. Comment on the static switch	147
Exercises: study of a voltage stabilizing device using a saturable inductance	148
Solutions to the exercices.....	151
References	153
17 - Soft materials for high frequency electronics.....	155
1. Complex susceptibility and permeability	155
1.1. Isotropic complex susceptibility and permeability.....	156
1.1.1. Physical meaning of χ' , χ'' , μ' and μ''	156
1.1.2. General dynamic regime.....	157
1.1.3. Kramers-Kronig relations.....	158
1.2. Anisotropic materials. Complex susceptibility and permeability tensors.....	158
2. Measuring the complex susceptibility and permeability	159
2.1. Internal and external susceptibilities	159
2.1.1. External susceptibility in a simple case	160
2.1.2. Effect of the demagnetising field on the drifts and losses	160
2.1.3. Skin effect and dimensional resonance	161

2.2. Reciprocity theorem	162
2.3. Measuring by perturbation of a coil.....	162
2.4. Two coil measurement.....	163
2.5. Frequency limitations in coil methods	164
2.6. Measuring toroidal samples	164
3. Elementary susceptibility mechanisms	166
3.1. Rotation mechanism	167
3.1.1. Isotropic rotation (or uniaxial symmetry).....	168
3.1.2. Anisotropic rotation.....	171
3.2. Wall mechanism.....	173
3.2.1. Ballistic behavior - Döring mass	174
3.2.2. Introducing damping - Wall mobility	176
3.2.3. Equation of motion for an isolated plane wall	176
3.2.4. Generalization to curved walls.....	177
3.2.5. Diffusion relaxation	177
3.2.6. Disaccommodation	178
4. Susceptibility in the demagnetised state: the homogenization problem.....	178
4.1. The approximation of additivity or of the mean	179
4.1.1. Snoek's model	179
4.1.2. The model of Globus <i>et al.</i>	180
4.2. Effective medium model.....	181
4.3. Wall contribution and rotation contribution	183
5. Susceptibility in the saturated state - Magnetostatic modes.....	184
5.1. Circular susceptibilities and permeabilities - Gyrotropy.....	184
5.2. Uniform magnetostatic resonance.....	185
5.3. Non uniform resonance: magnetostatic modes	187
5.4. The role of exchange interaction: spin waves.....	189
6. An overview of radio-frequency materials and applications.....	190
6.1. Spinels.....	191
6.2. Planar hexaferrites.....	193
6.3. Applications in linear inductive components.....	194
7. Overview of microwave materials and applications.....	197
7.1. The ferrimagnetic garnets	197
7.2. Microwave applications	198
7.2.1. Non-reciprocal devices	198
7.2.2. Tunable resonator.....	202
7.2.3. Microwave absorbers.....	203
Appendix: the effective medium method	204
Exercises.....	209
Solutions to the exercises.....	210
References	210
18 - Magnetostrictive materials.....	213
1. The Invar and Elinvar family	213
1.1. Controlled thermal expansion alloys.....	213
1.2. Alloys with constant elastic moduli	215
2. Magnetostrictive materials for actuators.....	216
2.1. Materials with high anisotropic magnetostriction.....	216
2.2. Terfenol-D.....	216

2.3. Use of Terfenol-D in actuators.....	221
2.3.1. Linear actuator.....	221
2.3.2. Differential actuator.....	222
2.3.3. Wiedemann effect actuators.....	222
2.3.4. Magnetostrictive linear motor.....	223
2.3.5. Magnetostrictive rotary motors.....	224
2.3.6. Sonar.....	225
3. Sensor materials.....	225
3.1. Metglas 2605SC.....	226
3.2. Sensors based on inverse magnetoelastic effects.....	227
3.2.1. Force sensor.....	227
3.2.2. Ultrasensitive magnetometry.....	228
3.2.3. Inverse Wiedemann effect torquemeter.....	228
3.3. Sensors based on direct magnetoelastic effects.....	229
3.3.1. Magnetostrictive magnetometers.....	229
3.3.2. Position detector.....	230
4. Integrated actuators and sensors.....	230
5. Conclusions and perspectives.....	231
Exercises.....	232
Solutions to the exercises.....	232
References.....	234

19 - Superconductivity.....	235
1. Introduction.....	235
2. Definition of superconductivity.....	236
3. Some fundamental properties of superconductors.....	237
3.1. Thermodynamic critical field and critical current.....	237
3.2. Characteristic lengths.....	238
4. Physical effects related to the phase.....	238
4.1. Flux quantization in a ring.....	238
4.2. Josephson effect.....	239
4.3. AC Josephson effect.....	241
4.4. Dynamics of a shunted junction.....	241
5. SQUIDS.....	242
5.1. The dc SQUID.....	242
5.2. The rf SQUID.....	244
5.3. The SQUID in practice.....	245
6. Type-I and type-II superconductors.....	246
6.1. Critical fields and vortices.....	246
6.2. The Abrikosov lattice.....	248
6.3. Critical current in type-II superconductors.....	249
6.4. Vortex pinning.....	250
7. Superconducting materials.....	251
8. Applications.....	251
References.....	253

20 - Magnetic thin films and multilayers	255
1. From control of the local environment to control of the physical properties.....	255
2. Preparation and nanostructure of magnetic thin films and multilayers	258
2.1. Introduction	258
2.2. Experimental techniques most commonly used to prepare magnetic thin films and multilayers	259
2.2.1. Sputtering.....	259
2.2.2. Molecular beam epitaxy (MBE).....	261
2.2.3. Chemical and structural methods for characterising thin films and multilayers	263
3. Magnetism of surfaces, interfaces and thin films.....	263
3.1. Increase in the magnetic moment at the surface of a transition metal.....	264
3.2. Surface magnetism in materials not possessing a moment in the bulk	265
3.3. Effects induced by the substrate on the magnetism of ultrathin epitaxial films.....	265
3.4. Effect of reduced dimensionality on magnetic phase transitions.....	266
3.5. Magnetic anisotropy of thin films.....	268
3.5.1. Shape anisotropy.....	270
3.5.2. Magnetocrystalline anisotropy	270
3.5.3. Magnetoelastic anisotropy.....	271
3.5.4. Effect of roughness and interdiffusion	272
4. Coupling mechanisms in magnetic multilayers.....	272
4.1. Direct ferromagnetic coupling by pinholes or by dipolar interactions	273
4.2. Coupling across a non-magnetic film in multilayers consisting of alternating ferromagnetic transition metal and non-magnetic transition or noble metal layers (example Co/Cu).....	274
4.3. Interfacial coupling between ferromagnetic transition metal films and rare earth films	275
5. Transport properties of thin films and multilayers.....	278
5.1. Electronic transport in metals.....	278
5.1.1. Classical image.....	278
5.1.2. Description of electrical conductivity in the framework of a band model, the free electron gas model	279
5.1.3. The two current model, spin dependent scattering in magnetic transition metals... ..	281
5.2. Finite size effect on the conductivity of metallic thin films.....	282
5.3. Magnetoresistance in thin films and metallic magnetic multilayers.....	284
5.3.1. Anisotropy of the magnetoresistance in ferromagnetic transition metals in bulk and thin film form	284
5.3.2. Giant magnetoresistance (GMR).....	285
5.3.3. The physical origin of giant magnetoresistance	287
5.3.4. Different types of giant magnetoresistive multilayers	288
5.4. Spin polarised electron tunnelling.....	291
5.5. Applications of magnetic thin film and multilayers	295
5.5.1. Magnetic recording media.....	295
5.5.2. Magneto-optical recording media	296
5.5.3. Soft materials.....	297
5.5.4. Magnetostrictive materials	297
5.5.5. Materials for microwave applications	298
5.5.6. Magnetoresistive materials.....	298
6. Spin electronics and magnetic nanostructures.....	300
References	301

21 - Principles of magnetic recording	305
1. Introduction.....	306
2. Overview of the various magnetic recording processes	307
2.1. Analog recording	307
2.2. Digital recording.....	310
2.3. Perpendicular recording	311
2.4. Magneto-optical recording	311
2.5. Domain propagation memory.....	312
3. Recording media.....	314
3.1. Particulate media	314
3.1.1. Stoner-Wohlfarth model.....	314
3.1.2. Superparamagnetism in particulate media.....	315
3.2. Granular media, metallic thin films.....	316
3.3. Continuous media: epitaxial single crystal films and homogeneous amorphous films.....	318
4. The write process	318
4.1. Field produced by a magnetic head.....	319
4.2. Stability of written magnetization patterns	321
4.3. Writing a transition with a Karlqvist head.....	323
5. The read process	326
5.1. Inductive readout.....	326
5.2. Magnetoresistive readout.....	329
6. Concluding remark	335
References	335
22 - Ferrofluids	337
1. Introduction.....	337
2. Characteristics of a ferrofluid	338
2.1. Stability	338
2.2. Types of ferrofluids and their production.....	339
2.2.1. Surfacted ferrofluids	339
2.2.2. Ionic ferrofluids.....	340
3. Properties of ferrofluids	340
3.1. Superparamagnetism	340
3.2. Interactions between particles: formation of chains.....	342
3.3. Viscosity	343
3.4. Optical birefringence	344
4. Applications.....	345
4.1. Long-life seals	345
4.2. Lubrication - Heat transfer.....	345
4.3. Printing.....	345
4.4. Accelerometers and inclinometers.....	345
4.5. Polishing.....	346
4.6. Dampers and shock absorbers.....	346
4.7. Applications of the optical properties of ferrofluids	346
4.8. Biomedical applications	347
4.9. Foreseeable developments.....	347
5. Surface instabilities	348

26 - Practical magnetism and instrumentation	441
1. Magnetization measurement techniques.....	441
1.1. Reciprocity theorem.....	441
1.2. Measurement of soft materials.....	442
1.2.1. Measurement of a toroidal sample.....	443
1.2.2. Epstein permeameter.....	444
1.3. Measurement of the magnetization of hard materials or of weakly magnetic materials	445
1.3.1. Force methods.....	445
1.3.2. Flux methods.....	447
1.3.3. Hartshorn Bridge.....	455
1.3.4. Measurement of anisotropy.....	456
1.3.5. Calibration of magnetization.....	456
2. Generation of magnetic fields.....	456
2.1. Magnetic field generation without using magnetic materials.....	457
2.1.1. Calculation of the field produced by a solenoid at any point in space.....	457
2.1.2. The solenoid.....	458
2.1.3. Superconducting coil.....	458
2.1.4. Bitter coils.....	460
2.1.5. Hybrid techniques.....	460
2.1.6. Pulsed fields.....	461
2.2. Generation of magnetic fields using magnetic materials.....	462
2.2.1. Some useful approximations.....	462
2.2.2. Flux channeling - case of a closed circuit.....	463
2.2.3. Flux channeling.....	464
2.2.4. Permanent magnets.....	466
2.2.5. Almost closed U-shaped magnet.....	468
2.2.6. The magic cylinder.....	468
3. Measurement of magnetic fields.....	469
3.1. Hall Probe.....	469
3.2. Flux gate magnetometer.....	470
Reference.....	472

APPENDICES

1. Symbols used in the text	475
2. Units and universal constants	479
1. Conversion of MKSA units into the CGS system, and other unit systems of common use ...	479
2. Some fundamental physical constants.....	480
3. Periodic table of the elements	481
4. Magnetic susceptibilities	483
5. Ferromagnetic materials	487
6. Economic aspects of magnetic materials	489
1. Introduction.....	489
2. Hard materials for permanent magnets.....	490
2.1. The applications for magnets.....	490
2.2. The main families of permanent magnets.....	490

2.3. Bonded magnets.....	492
2.4. Geographical distribution	492
3. Soft materials.....	492
3.1. Soft iron.....	492
3.2. Iron-silicon alloys.....	493
3.3. Special alloys	493
3.4. High frequency materials.....	493
4. Materials for magnetic recording.....	493
5. Other magnetic materials	494
5.1. Magnetostrictive materials.....	494
5.2. Ferrofluids.....	494
General references	495
Index by material	497
Index by subject.....	503
